RESEARCH INTERESTS	My research interests revolve around using big data, traditional field methods, and remote sensing to study a range of forest phenomena. I currently study temperate liana (woody vine) ecology, impacts, and distributions using field experiments as well as satellite and UAV remote sensing. I am testing the effect of releasing temperate forests from lianas, creating large scale species distribution models for lianas using Google Earth Engine, and quantifying liana abundance from UAV LiDAR and multispectral imagery using machine learning and artificial intelligence. Additional interests include silviculture, agroforestry, urban forestry, forest restoration, microclimates, and forest regeneration.
